DCS X GDG Cloud Recruitment Task Submission

Overview

This project demonstrates a practical cloud solution built around two core AWS tasks: static website hosting on Amazon S3 and a serverless Lambda greeting function. The static portfolio is designed as a simple public-facing website and the Lambda handler accepts JSON input and returns a custom greeting message.

Services used

• Amazon S3 for static website hosting
• AWS Lambda for serverless compute
• Python for the application logic and local validation
• Local HTTP server for demo preview

Steps followed

1. Created a responsive portfolio website with HTML, CSS, and SVG assets.
2. Validated the site locally using a Python HTTP server.
3. Implemented a Python Lambda function that reads a JSON payload such as {"name": "Alex"} and returns {"message": "Hello Alex, welcome to Cloud Computing!"}.
4. Verified the Lambda logic through a local Python test invocation.
5. Captured a screenshot of the preview for documentation.

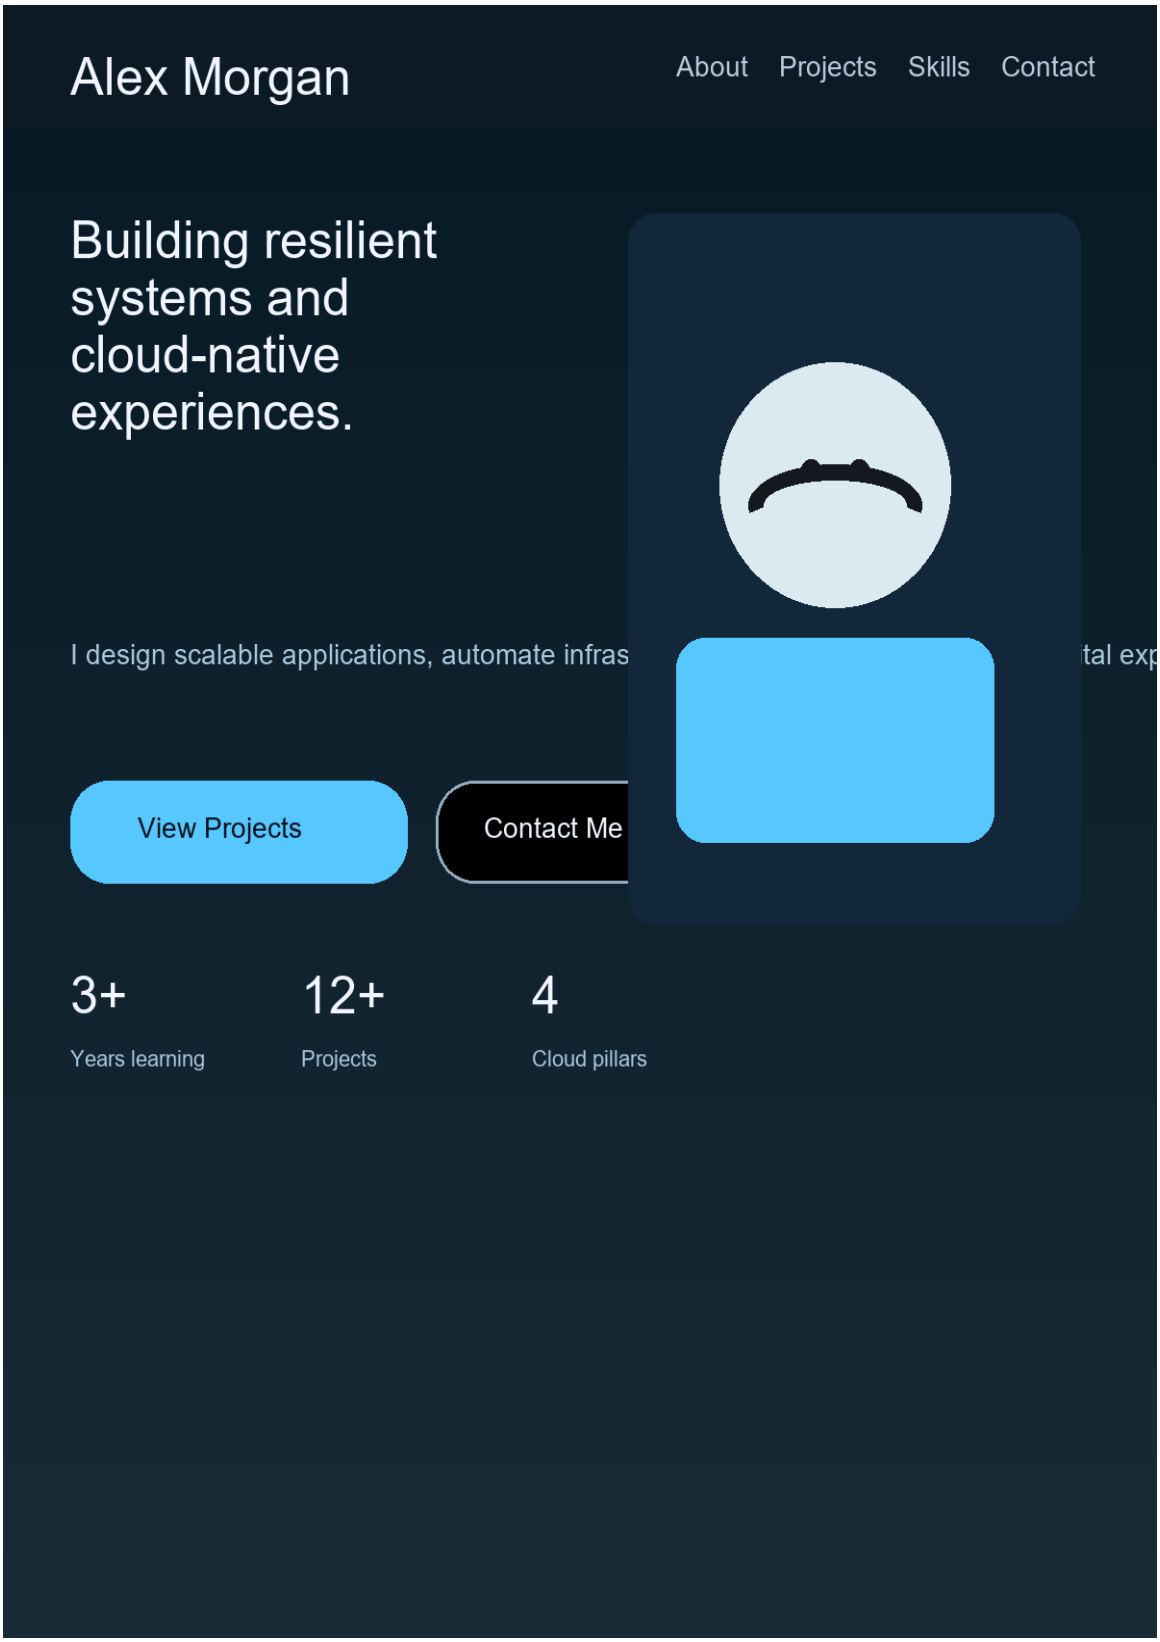

Demo link

Local preview URL: http://localhost:8000

Note

This environment does not currently include an active AWS account or configured CLI credentials. The project assets are therefore prepared and validated locally, ready for deployment in an AWS account once access is available.
